Feedback to users:

I have just "installed" the latest release (2021-07-01) of Wombat on the HPC.  
To make use thereof, type (or add to your ~/.bashrc) the following:  
module load wombat

Optionally, you can load the specific version, e.g.:  
module load wombat/2021.07.01 or module load wombat/2018.01.17

This should add "wombat" into your path, so you should be able to execute it by simply typing:  
wombat

If for some reason, you need the full path of Wombat, after loading the module, you can see the full path by executing:  
echo \$WOMBAT\_DIR  
Should return "/soft/sl7/gen5/wombat/2021.07.01"

You can then, of course, use this system variable in commands too:  
ls \$WOMBAT\_DIR/bin  
Should return "wombat".

Let me know if it doesn't work.

Kind Regards  
Albert
